1. INTRODUCTION

Managing expenses among friends, roommates, or travel companions is a common challenge. While it is often convenient for one person to cover upfront costs such as groceries, utilities, or group meals, this convenience quickly disappears when it comes time to settle. According to conducted interviews, some forget who owes who, lose track of exact amounts, or feel uncomfortable constantly reminding their debtor. This is corroborated by a survey done by Zelle in 2018, where about half of the general population (54%) indicated they would follow up with friends until they received their money back for a group gift [1]. Lewis and Perry [2019] state that money management is as much about navigating relationships as it is about balancing accounts, where debts between friends are often emotionally charged interactions. For example, loans are typically paid back quickly to alleviate the social obligation they carry [2]. Frequent questions like "How much do I owe for my half of the electricity bill?" or "How much am I owed for paying for my friend's lunch?" emphasize the recurring uncertainty within circles. Without a reliable system, these situations often lead to confusion, errors, and even strain personal relationships. Furthermore, trust and interface quality significantly influence whether users adopt and continue to use mobile payment services, demonstrating the importance of a clear and secure design in a financial application solution [3].

In many circumstances, the people who face these challenges are college students, small travel groups, and friend circles. They share costs in their everyday lives and need a way to manage splits more efficiently. With how busy a college student is, how fast-paced the life of a traveler is, and how close relationships can be between two friends, they deserve a streamlined process to track running totals, whether individual or over an extended period.

The problem Splitsy aims to solve is the lack of organization and ease of use in managing shared expenses. Current methods like spreadsheets, groupchats, or one-time payment apps like Venmo or Zelle, are not designed for cumulative, group-oriented expense tracking. In fact, Shaikh et al. [2025] note that current expense tracking applications often have issues with "security, data quality, and user experience, especially when they include sensitive financial data". Our proposed application addresses these shortcomings by offering a human-centered interface that simplifies tracking, splitting, and settling. These things will be achieved through features like consistent language, organized layouts, and the ability to scan receipts for semi-automated splitting.

People should recognize this problem and care about a solution because money-related misunderstandings can damage trust and relationships between close friends. By improving transparency, reducing cognitive load, preventing errors, and automating reminders, this proposed app will ensure simplicity, fairness, and user-friendliness.

2. INTERVIEW END USERS

2.1 Population and Methods

The population interviewed was made up of 10 college students aged 19-21. They were majority off campus but included on campus students as well. The method used to collect data was a semi-structured interview. Guiding questions were provided, but leniency was allowed to veer into other conversations regarding the topic.

2.2 Results and Pressing Issues

The results indicated that the population chosen often shares expenses with other people. Their primary practices of settling these expenses include Zelle, Venmo, cash, or sometimes Splitwise. They often rely on their memories to keep track of these totals. Some major challenges include forgetting to pay back money, awkward reminders, inconsistency in payment methods, and confusion in calculating costs. These practices also often depend on the closeness of the relationship between the two parties. When trust is strong, formal reminders are less common, as there is confidence that reimbursement will eventually happen.

In terms of desired features, there is a strong demand for receipt scanning, automatic calculation, and notification/reminder systems. These features would hinge on a running total system as well. While there is a hesitation for adopting new practices, ensuring a simple interface that is easy to learn is something that may help increase adoption rates.

3. CURRENT SOLUTIONS

There are currently two popular apps that aim to improve the experience of splitting payments between people: Splitwise and Chipp. The first app, Splitwise, allows users

to have “friends” who are other users and track the status of their balances with each friend. This status can be that user A owes user B, user B owes user A, or they are settled up. Expenses can also be split with groups, such as roommates, families, and friend groups. The Splitwise app also has a pro feature to scan receipts, convert currency, and visualize spending by category. Users of the app need to pay for the pro subscription in order to access key features like receipt scanning and removing ads. The app does not allow for complicated bill-splitting scenarios, which can be a source of frustration [4]. Additionally, a limitation is that Splitwise does not include an integrated payment system, which forces users to switch to external platforms to settle the payments [4].

The second app, Chipp, similarly allows for expense tracking among friends and groups. Groups can be created for events such as “Spring Break Trip” and “Family.” Users can also scan receipts directly in the app and view a summary of the items along with the cost of each item. Users can then split the costs within this receipt. Unlike Splitwise, Chipp has a built-in wallet with access to credit cards and linked bank accounts. At the same time, another application “Snap and Split” utilizes receipt scanning, however errors can occur if the scan quality is poor or handwriting is unclear [5]. This suggests that while receipt based features can be valuable, their effectiveness depends on the reliability of Optical Character Recognition (OCR) technology.

Shaikh et al. [2025] have observed several limitations in current expense splitting apps; in addition to data entry errors, applications fail to offer flexibility in splitting costs by percentages, shares or custom contributions, which means users need to use other tools to calculate exact amounts. Similarly, some apps do not provide detailed activity logs or mechanisms for dispute resolution, which makes it difficult to verify past expenses [6]. In a survey conducted in 2022, results showed that 26 out of 30 respondents reported satisfaction with receipt scanning apps, however many apps limit this feature to individual tracking rather than shared expense tracking [7].

The manual solution to splitting payments would be to track payments through methods such as writing them down or remembering them without any form of tracker. The advantage of this is it can be a simpler process, but the disadvantages are manual errors, forgetting expenses, and delays in payments.

4. CURRENT INTERFACE

The current interface for managing transactions between users is primarily through the Splitwise application. In this app, users can track their shared expenses, record various payments between each other, and view balances. In terms of other popular solutions, many people utilize calculators and cross-platform management across Zelle, CashApp, and Venmo alongside mobile communication.

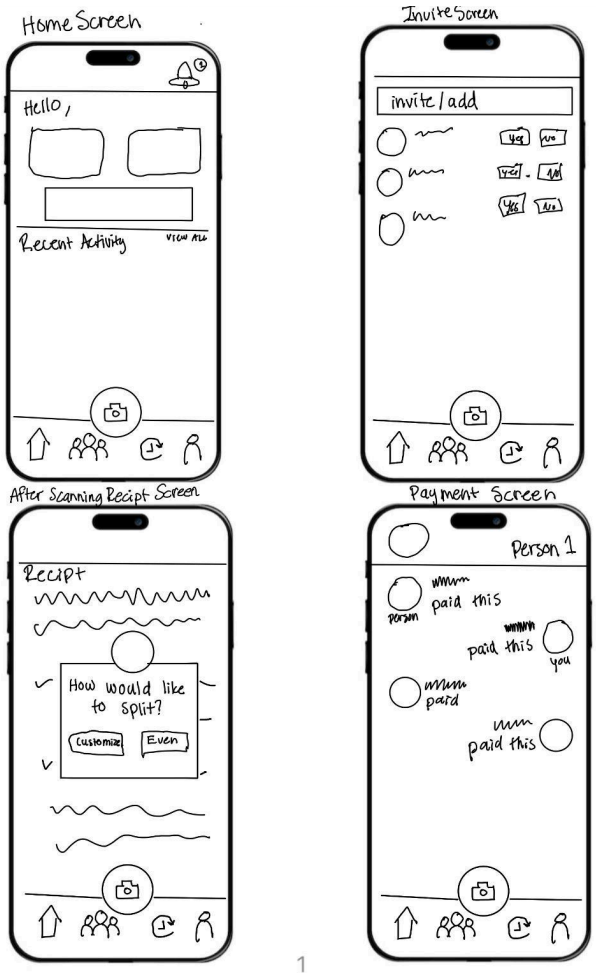
The primary issues with Splitwise arise from the user interface. Upon downloading and testing the application, there was some confusion regarding workflow and usage. One issue includes the limited transaction options on a recipient’s page. In this scenario, we will assume that Tom loaned Alex $25 and Alex paid him back $10. However, if Tom wanted to lend Alex more money, there is no option other than “Settle Up,” which is interpreted as Alex paying back Tom. Additionally, the language used is ambiguous. For instance, when the interface states “Tom paid Alex,” it is unclear whether this indicates that Tom initially owed Alex or that Tom *now* owes Alex. If another expense is added, the interface uses the word “lent.” The language is not consistent. If the app used more natural, conversational language such as “has to pay” or “paid you”, this could reduce confusion and improve clarity [4].

Another workflow issue is the check splitting interface. In many restaurants, the option to split a check is unavailable. In this case, everyone’s bills are consolidated into one. One member of the party usually pays and the rest are left to calculate the amount owed by each person based on their dish, their fair share of the appetizer, and tip. In order to get to the unequal payments tab that this scenario describes, users must navigate through 3 additional clicks. This leads to a page where they must enter the exact amount owed by each member. Thus, users cannot perform these complex calculations within the app itself. According to an Apple user review, switching to a separate calculator app to do the math often causes the expense entry in progress to close unexpectedly. In addition, the app further limits users by restricting them from adding more than three transactions in a single day. Research on financial apps echo these sentiments, noting that data entry errors and inconsistencies are some of the biggest problems with current systems, and that limited flexibility in splitting expenses often forces users to turn to outside tools and this diminishes the app’s value [6].

These challenges, along with several others, highlight that Splitwise is not always easy to follow for new users and can become frustrating for long-time users as well.

5. PROPOSED INTERFACE DESIGN

5.1 Sketches/Describe Interface



1

In our tentative interface design, we plan to include a bottom navigation bar with five main features: receipt scanning, a homepage, a friends page, a history page, and a profile page. In a study conducted with 147 participants, it was found that compared to many existing navigation designs, improved designs consisted of a floating action button and a bottom navigation design pattern to help users interact with the system more efficiently [8]. Additionally, we plan to have a static menu since the study also noted that a static menu is more favorable to users than a dynamic menu [8].

The homepage will display welcome messages, recent transaction activity, and any missed notifications, helping users stay updated at a glance.

The friends page will list all friends using the app, allowing users to easily split expenses and view payment histories, as shown in our sketch through the invite and payment screen.

When clicking the camera button, the app will open the camera and allow users to capture their receipts. After scanning, they will be prompted to choose a splitting method. The user will then choose whether to divide the total evenly or customize by selecting specific items and assigning them to friends. We plan to use a OCR (Optical Character Recognition) tool called Tesseract, one of the most accurate open-source OCR engines that can be trained for multiple languages [5], or the Azure Form Recognizer API, which extracts meaningful data from receipts and returns it in JSON format [7].

Finally, we aim to incorporate push notifications that remind users when they need to pay someone back, reducing the awkwardness of reminders and improving accountability.

5.2 Research and Interviews impact on interface

The research and client interviews impacted our designs by helping us create features curated to solve recurring problems that happen when splitting amongst people. One of the main problems we noticed when people are splitting payments is that keeping track of when friends paid for an item is difficult. After a couple client interviews, we realized that one of the main problems that the interviewees kept encountering was the fact that they would forget when they needed to pay someone back or not. Making tracking between friends more transparent also mitigates the social obligations that accompany lending and borrowing between friends [2]. This impacted our design by realizing that we needed to have this application organized by running totals and numbers by an individual person, so users can always see a clear history of what they owe and what others owe them without relying on memory alone.

Another situation we noticed when researching and conducting interviews was the difficulty of having to do manual calculations when splitting with a group. Interviewees explained that splitting costs from a receipt often turned into a group effort with everyone pulling out calculators, especially when trying to handle uneven splits manually. This impacted our design choice to add a receipt scanning feature that uses AI to itemize expenses. This gives users the choice to quickly apply either a custom split or an even split, making the manual calculation easier With further investigation, we noticed that we can utilize tesseract OCR for receipt scanning and person-based tagging [5], which can further reduce complexity..

Lastly, one of the most common concerns was the social awkwardness that arises from asking for money back. Interviewees shared some insights on how they felt uncomfortable when they had to repeatedly ask their friends to pay them back, which sometimes strained their relationships. Through research we also noticed that people are more likely to use digital apps to communicate with weak social connections about debt compared to asking in person [1]. This impacted our design by incorporating gentle, automated reminder features, so users can settle favors without the stress of direct confrontation.

5.3 Tech Stack

This project will be a cross-platform mobile application with a React Native frontend utilizing JavaScript/TypeScript and a Node.js/Express backend. MongoDB will store user profiles, transaction histories, group expense data, and more. AI services such as Google Vision and other options will allow the application receipt-parsing. To test the application, Expo Go will support live demonstrations. In terms of hardware, the application requires a mobile device capable of taking photos with the back camera.

6. CONCLUSION

Our proposed interface aims to dismantle some of the major problems observed with current solutions of shared expense management systems. By reducing social discomfort, simplifying calculations in bill-splitting, and improving the transparency of expenses, this project aims to provide a reliable tool that increases trust and clarity in relationships.

APPENDIX

Krithika Interviewee #1: Off Campus College Student at UF (20 y/o male)	1. He splits expenses 1x a week primarily in the context of groceries and small favors (if a friend does not have cash). A running total is kept in his head mostly. The process does change depending on his relationship with the person that owes him money. He is more transparent with his roommates and close friends over acquaintances. 2. Challenges he faces in splitting expenses is that sometimes the people that owe him forget. He recalls a scenario where someone owed him $30 for nearly two years and he had to keep the receipt for that long. He said he doesn't necessarily directly resolve these owed expenses and just trusts them to pay him back eventually. Additionally, he mentioned that ⅔ of his roommates owe him currently. 3. His current practices include Zelle and simply paying/requesting after an amount is owed. He majorly keeps a running total in his head, but he mentioned that sometimes his roommates forget. He mentioned that reminders would be helpful. 4. In this scenario, he would pay for the bill, calculate the cost of each person by doing calculations by hand, and then depending on the others to Zelle him. He mentioned he keeps the receipt for record. He mentioned that they don't split the tip and someone in the friend group tips cash. 5. He mentioned he would like a running total between friends so that any transactions between 2 individuals would be updated to verify how much is owed between them.
Krithika Interviewee #2: Off Campus College Student at UF (20 y/o female)	1. She doesn't split expenses too often. It is something around 1-2 times a month. It is primarily in the context of gas, meals, and other group expenses. For close friends, she doesn't need to remind anyone, but for those less known, an official text may be the process. 2. The major challenge she faces is people forgetting to pay her back. Confusion is resolved with communication via texts. 3. Current tools she uses are Zelle and Venmo. Calculations for specific amounts are done with a calculator. Other apps have not been consulted as the whole situation is not super hectic for her in specific. 4. The process is primarily doing the calculations by hand and then having everyone zelle/venmo the bill-payer. 5. A key feature is having a notification system for payments as well as an easily trackable system that keeps a clear account of who owes what.
Jett Interviewee #1: Off Campus College Student at SF (19 y/o female)	1. At least once or twice a week. This is in the form of groceries. Sometimes she takes a trip to Publix with her roommates and will buy each other's stuff and ask how much is owed. Or will get food and one person orders for everyone, so she has to pay back for the meal. Process changes depending on the person/group because when with some people, they won't allow her to pay them back or will not allow them to pay as much and will not be specific about what is owed. 2. The challenge of splitting expenses is the process of calculating to verify how much said person owes. It's not that hard but sometimes can be a bit confusing. Doesn't go out with friends a lot but when she does, they have their own money so they already try to pay separately. An example was when she went to different grocery places (Target, Lowe's, Publix) with roommates. She bought stuff for her roommates at Lowe's, roommates bought stuff of hers at Target. It took about 5 minutes to calculate it out and ended up being even so they didn't have to owe each other anything. She resolves problems by retracing steps and reminding each other of who bought what and remember how much it was. Usually keeps receipts around in case it is forgotten. 3. Calculator + brain. Didn't know about any apps that helped keep track of shared expenses. What if I get it/roommates get it and don't know how it works? 4. If people have cash, that's a good way to do it. But if not, she will have to make one person pay with a card then pay that person back. Get a receipt, look for food/drinks you ordered, calculate on a calculator how much your food was, round it up, then send the money. Usually somebody will cover appetizers/taxes if not included in the rounding. If it's a shared meal, she divides by the amount of people shared with. Don't really split appetizers. Not disagreements, just a bit of confusion when reading the receipt because some places have weird categorization/naming of items. 5. She would want it to be straightforward and not complicated. If her family/friends were to use it, it needs to be easy to use. Scanning the receipt and having the app calculate everything for you would be the easiest thing.
Jett Interviewee	1. He finds himself splitting expenses with others multiple times a week. It is usually for food when he has to pay them back after they pay for it. He finds this situation most often when going on group grocery

#2: Off Campus College Student at UF (21 y/o male)	trips and restaurant outings. Also rarely when he goes traveling with others, they need to split hotel expenses. Usually he's the one to buy everything then they send money to him but sometimes he owes somebody, so the context changes when he owes somebody. 2. Trying to figure out who wants to pay for it all then making sure everybody can send the money back in a timely manner. Other people owe other people different amounts so sometimes it's easier to get a net sum of who owes who over time. Getting an idea of the total amount of what everybody owes each other should be clear-cut and convenient. An example was when he was in Orlando with a friend and they would buy food (alternate who buys it) and figure out the net difference between how much he owed and what his friend owed. To solve any problem, he volunteers to pay first then he has to make sure he gets everybody to pay him back. 3. He just uses Venmo to track expenses. He likes that it's easy but there's no group feature where multiple people contribute to a shared balance or put in how much they owe each other and calculate who sends who an amount. 4. He offers to pay with a card, requests a receipt, then when he has time, he will calculate out the owed amounts per person based on how much each person paid. He will either message them, request on Venmo, or tell them to pay him. The only disagreement is who should cover the initial bill, but that's why he defaults to volunteering to pay it first. 5. He wants a program where everyone gets added to a group then people just list down what they owe who and it simplifies it down to 1 lump payment. Maybe translate a line of people owing who to a web of people. This would help reduce the amount of transactions. Adding a chat to the app would be good too.
Kriti Interviewee #1: Off Campus College Student (20 y/o female)	1. She found herself splitting expenses mainly with her roommates once a week, and usually for groceries that were going to be shared between her and her roommates. 2. She said that the main challenge she faces when splitting the expenses is knowing when it's her turn to buy the groceries or figuring out who hasn't bought them. To resolve the disagreements, they would look back at their messages in the group chat and try to find the last time they mentioned going out to buy groceries, but sometimes it would take a while, as they frequently discuss topics in this group chat. 3. No, they don't really use any tools to split costs or keep track of shared expenses, except for their past chats on messages. They never really used an app because they didn't realize that one exists. 4. She explained that if it were just among friends, they'd usually take a picture of the receipt, send it in their group chat, and figure out how to split the bill later, sometimes even the next day. But they occasionally forget, and then it feels awkward to remind their friends. They typically split the total including tax but not the tip. However, for roommates, she said they also try to do a turn by turn basis, but sometimes that even gets more complicated too and sometimes feels like she's always the one paying. 5. She said a key feature she would want is just to be able to track who paid for what and also a way for there to be a notification or a reminder for people to pay, in case they forgot to.
Kriti Interviewee #2: On Campus College Student (19 y/o female)	1. She often ends up splitting restaurant expenses with her friends, usually about twice a week. Sometimes she sends the payment right away through Venmo or Zelle, while other times it happens a day or two later. 2. She said the biggest challenge is timing. When they wait a day or two to pay back money, it's easy to forget. She gave a recent example of when she went out to eat last weekend, took a picture of the receipt, sent it in the group chat, and planned to split it later. But a couple of the friends forgot to send the money until someone reminded them, which felt a little awkward. She usually resolves any confusion by double-checking the receipt together and making sure everyone's paying for what they ordered, including tax but not tip. 3. They tried using a few apps, one being Splitwise, but eventually stopped. It became inconvenient since not everyone in the group was using the same app. Some people used a different one, and others didn't have any app at all, so they usually just ended up splitting things manually anyway. 4. If the restaurant doesn't split the bill, she usually puts the receipt in the middle, figures out what everyone ordered, and splits shared appetizers evenly. Then she adds tax and tip, one person pays the whole bill, and everyone else sends her money through Venmo or Zelle right after. If there's ever confusion, she just double-checks the receipt with everyone and rounds up to keep it fair. 5. She said the ideal way would be just scanning the receipt, picking what everyone ordered, and having it split everything, tax and tip included, automatically. Just to have a more seamless way of dealing with splitting costs.

Shreya Interviewee #1: Off campus UF Student (21 y/o male)	1. He typically splits expenses for groceries weekly with his girlfriend and common household items with his roommates. After a grocery trip, he usually looks at the receipt and decides how to split the grocery items with his girlfriend. For his roommates, he usually purchases the item and then lets them know how much to pay him back through either Venmo or Zelle. 2. He does not experience many challenges with splitting expenses. Sometimes he does not know if he should split certain items with his roommates, which can cause some confusion and result in him paying entirely for certain items like seasonings. 3. He does not currently use any tools or apps for tracking expenses because he does not need to split often enough and he has not experienced any disagreements with regards to splitting. 4. At a restaurant, usually one friend will pay the cost of the entire bill. Once they receive the receipt, each person will look at it, calculate the cost of their items, and send their amount to the person who paid. He has not experienced any disagreements with this process. 5. A key feature that he is looking for is integration with common payment platforms like Venmo and Zelle. He would like it if the tool can scan a receipt and automatically or easily configure Venmo requests.
Shreya Interviewee #2: Off campus UF Student (21 y/o female)	1. She typically splits costs with her friends multiple times a week. These costs are usually at restaurant outings. Some of her friends use Venmo, some use Zelle, and some don't split but switch off on who pays. 2. She does not face any challenges with splitting expenses. If there is confusion about how much to pay, she lets them know if they paid the wrong amount. 3. She does not currently use any tools to split costs. She prefers to use Venmo and Zelle directly for convenience. She finds it easy to split when the receipt is right in front of her. 4. At a restaurant, one friend in the group will pay the full check and everyone else will pay them back their respective amounts after calculating with the receipt. She has not experienced any confusion or disagreements with this process. 5. A key feature that she would like is for the tool to configure splitting the tip so that the person who paid the check in full is not responsible for the entire tip.
Aarushi Interviewee #1: Off Campus UF student (21 y/o female)	1. She usually splits expenses after a trip or big event. For small splits, it's typically at the moment. And for expenses between roommates, keeps track of all of the expenses and will just settle up at the end. 2. A challenge faced is that people won't let her pay for things sometimes, and wants to pay them back. Additionally, she is sometimes scared to remind people that they owe her for fear of coming off as pushy. 3. Uses splitwise to keep track of expenses between friends, and for smaller expenses will figure it out through text message. Between roommates, keep track on a whiteboard in the living room where each person can just add what they bought. This also makes it easier to switch off on who needs to buy things. 4. The person who pays the full amount will take a picture of the receipt and send it over text. And then will share the amount that needs to be split equally. So for example if there are 5 people and the cost of tax, tip and appetizers is $30, then each person will pay $6 plus whatever their item cost is. 5. A key feature would be for the app to send automatic reminders telling them how much they owe a certain person so that people don't have to be confrontational.
Aarushi Interviewee #2: Off campus UF student (19 y/o female)	1. On average, about twice a month, and mostly for restaurants. When studied abroad, she split bills a lot more often, and a lot of time was spent ensuring that everyone received their money 2. Whoever fronts the bill has it rough because people will sometimes do the math wrong and might send less money so the split is not accurate. There are also a lot of different methods of sending money, and not everyone has everything, so you have to figure out who has what app. Additionally, people say they'll pay you back later, but then forget. When she studied abroad, figuring out the currency exchange rate took a long time to figure out. 3. Used splitwise once, but the issue was that not everyone in the group had the app or wanted to download the app, so had to figure out different ways to track the expense. Because some people have the app and some don't, it's just easier to use text messages 4. If she is the person that pays the bill, she will send a picture of the receipt and venmo/zelle details. Usually has other people do the math themselves because doesn't want to seem too uptight about it and also that takes too much time. If the person hasn't sent the money in a week, then will reach out 5. Some kind of tap feature or card reader, where you just tap your phone with others and the money goes straight to apple cash or bank account. Or a feature where you can scan a receipt and have a box that includes tax and tip and it gives you the amount to pay.
